Telecommunication Industry Operating Benchmarks

Operational and market capitalization data for 113 telecommunication companies

1-Jan-2022

Version

VERSION	NOTES
2021-1.1	Initial version, dated 04.01.21
2021-2.1	Updated financial and market cap data for 06.25.21. Removed companies that merged or were taken private.
2021-3.1	Updated financial and market cap data for 11.30.21. Removed companies that merged or were taken private.
2022-1.1	Updated financial and market cap data for 01.01.22. Added companies and removed those that merged or were taken private.

Versioning convention: This document is versioned as follows: YYYY.N.n, where YYYY is the year, N is the major release number, and n is the minor release number. A major release includes one or more of the following: the number of companies changes; reports and analyses change; financial and market cap information are updated, and a new date is attached to the report. A minor fixes errors, including data errors, formatting errors, and inconsistencies.

2022 Telecommunication Industry Report: Key Takeaways

- The Telecommunication industry 3-year CAGR is 1.6% (overall dollars growth). The average company 3-year CAGR is 1.0%.
- The average Telecommunication company has gross margins of 56.5%, invests 17.1% of revenue in selling, general, and administrative expense, 6.2% in research and development, and generates 15.0% operating margin, 36.1% EBITDA margin, 10.4% free cash flow, and 6.8% return on invested capital.
- The Telecommunication company average inventory turns is 41.9. The median is 22.0. The difference between the average and the median indicates a few outliers raise the average. The median is more in line with the industry operational structure.
- The average Telecommunication company has 107.5% PP&E, and 75.3% in goodwill and intangibles, all as a percentage of revenue. Goodwill and intangibles are a proxy for mergers and acquisitions; based on this measure, Telecommunication is among the highest industries in mergers and acquisitions.
- Telecommunication companies are asset intensive, with a high level of investment in PP&E as a percentage of revenue; the best indicator of market cap multiple is return on investment (ROA, ROIC, ROCE, and economic profit).
- Telecommunication companies with higher inventory turns tend to have significantly lower market cap multiples than companies with lower inventory turns. This is an indication that inventory turns is a poor indicator of company market performance. (Note: controlling for gross margin yields the same conclusion).
- Telecommunication companies require significant CAPEX in order to be competitive.
- Historical analysis (using aggregate data and ratios) indicates the operational structure is essentially the same as it was a decade ago. This includes similar gross margins, operating margins, asset intensity, inventory turns, and cash flows. This indicates the industry has a certain physical setpoint and that there are individual winners and losers around that setpoint, but that the overall industry is not operationally performing better than it was a decade ago.
- Individual operational measures are poor statistical predictors of market cap multiple. Quartile analysis was performed to contrast the operational characteristics of market cap multiple leaders with others.
- Market cap multiple leaders have cap multiples that are 2.4X average and 9.7X laggards. Leaders have significantly higher return on investment (ROA, ROIC, and economic profit).
- From a supply chain management perspective, data in this report supports the thesis that market leaders run their supply chains with more of a profit center mentality than a cost center mentality, which has historically been the case. This further suggests supply chain management has evolved to a sophisticated multivariate decision science, rather than a unidimensional cost management function.

Data Set

Information on the companies and the data set used in the analysis.

Data Set

COMPANIES The data set includes 113 publicly-traded Telecommunication companies.

REVENUE

Aggregate revenue for companies in the data set is \$1.5 trillion for the latest reporting fiscal year as of the date on the cover of this report.

MARKET CAPITALIZATION

Aggregate market cap for companies in the data set is **\$1.9** trillion as of date on the cover of this report.

\$1.9T

\$1.5T

Notes:

- 1. Unless otherwise noted, all company financial data are based on trailing twelve months results as of the date on the cover of this report.
- 2. All market capitalizations are as of the date on the cover of this report.
- 3. M=million; B=billion; T=trillion.

1. Unless otherwise noted, all company financial data are based on trailing twelve months results as of the date on the cover of this report.

2. All market capitalizations are as of the date on the cover of this report.

3. M=million; B=billion; T=trillion.

This report provides analysis of the following variables (and derivatives) for trailing twelve months (TTM) results and for the ten-year historical period.

REVENUE	CASH	INVENTORY
GROWTH RATE	DEBT	DAYS IN PAYABLES
GROSS MARGIN	NET CASH	DAYS IN RECEIVABLES
SELLING, GENERAL, AND ADMIN	EBITDA	CASH-TO-CASH CYCLE
RESEARCH & DEVELOPMENT	EQUITY	CAPITALIZATION TO REVENUE
REVENUE PER EMPLOYEE	CAPITAL EXPENDITURES (CAPEX)	CAPITALIZATION TO EBITDA
OPERATING PROFIT	PROPERTY, PLANT, AND EQUIPMENT (PP&E, NET)	RETURN ON INVESTED CAPITAL
NET PROFIT	GOODWILL	RETURN ON ASSETS
FREE CASH FLOW	DEFERRED REVENUE	RETURN ON PHYSICAL ASSETS
STOCK COMPENSATION	REMAINING PERFORMANCE OBLIGATIONS (RPOS)	ECONOMIC PROFIT

Data Set Three different analysis approaches in this analysis

worldlocity 10

APPROA	АСН	DESCRIPTION	EXAMPLE	GOOD FOR
1. Aggregate ave	erages	Averages are computed by adding up all numbers from all companies. For example, the gross margin for the industry would be the sum of all revenue for all companies minus the sum of all COGS for all companies (divided by the sum of all revenue for all companies).	Average Gross Margin % = (sum of all revenues minus sum of all COGS) / sum of all revenues	Overall industry structure and operations; smooths outliers.
2. Averages of p	ercentages	Averages are computed by taking the averages of all percentages for all the companies. For example, the average gross margin % is the sum of all gross margin %s for all companies divided by the number of companies.	Average Gross Margin % = (sum of all gross margin %s) / (number of companies)	Comparison across companies.
3. Quartile analy	/sis	The market cap multiples of all companies are divided into quartiles. The operating characteristics of the top quartile companies are compared to the others. Likewise, measures for each company are divided into quartiles and the average market cap multiple within each quartile is shown.	 Isolate each quartile of market cap multiples; compare gross margin of leaders to others. Isolate each quartile of gross margin; display average market cap multiple within each gross margin quartile. 	Understanding characteristics of leaders.

Overall Market

Summary of the market using the companies in this report as a proxy for the overall Telecommunication market. Charts in this section use the "aggregate averages" approach.

Overall Market YOY growth rates, 2011-2021

NOTES & INSIGHTS

- Telecommunication market CAGR for the past decade was 1.3%, which is lower than the global current dollar GDP growth rate (2.8%). It is also lower than BEA Telco growth rate numbers (3.2%).
- BEA numbers are for US domestic output only and are shown here for comparison purposes only.
- Growth rates in the early part of the decade were higher, probably due to the rebound from the great recession of 2009-2010.

worldlocity 12

Notes:

- 1. "Telecommunication Companies" represents all companies in the data set for which there are year-over-year revenue numbers. The number of companies varies from year-to-year based on companies going public and some companies merging or being taken private as the decade progresses.
- "BEA Telecommunication Output" growth is calculated from the US Bureau of Economic Analysis (<u>https://apps.bea.gov/iTable/iTable.cfm?reqid=150&step=2&isuri=1&categories=gdpxind</u>), GDP by Industry. Telecommunication output as defined here is based on output of the following sub-industries: Broadcasting and telecommunications. BEA updates its past numbers periodically, so past reports may not reflect the same past BEA numbers.
- 3. World GDP and US GDP numbers are sourced from The World Bank (data.worldbank.org)
- 4. World GDP and US GDP growth rates are based on *current* dollars. This means they have not been adjusted for inflation. *Current* numbers are used to ensure apples-to-apples comparisons with Telecommunication market growth rates. Note that GDP growth rates are typically reported in constant dollars pegged to a certain year in order to account for the effect of price inflation. Thus, GDP growth rates commonly reported in media are typically lower than those shown here.

Analysis Summary Operational ratios based on aggregate data, TTM¹

Notes:

- 1. All revenue and cost numbers are aggregate values for all companies for the trailing twelve months (TTM) as of the date on the cover of this report.
- 2. Growth rate is based on total dollars growth of the industry over the past four years.
- 3. Market capitalization ratio is aggregate market capitalization for all companies as of the date on the cover of this report divided by total revenue for all companies on TTM basis.

- These data indicate that the operational structure of the industry has remained relatively constant for the past decade.
- This indicates that industry operates around a certain "setpoint" driven by physics and physical characteristics.
- That said, individual companies deviate significantly from the overall structural setpoint, resulting in significantly different company-level operational results (next section).
- The final three years of CAGR are one-year growth rates (due to lack of data).
- Historical numbers beyond ten years have fewer companies and need further analysis for apples-to-apples comparisons.

Analysis Summary

Charts that summarize key variables in the report. Charts in this section use the "averages of percentages" approach. In other words, it shows the averages of all percentages for all companies. (These numbers will differ from industry structural numbers in the previous section)

Analysis Summary Average and median for different variables, TTM

worldlocity | 16

The table below contains the average and median values for the 113 companies investigated. This shows that the average Telecommunication company operates with a gross margin of 56.5%, spends 17.1% of revenue on SG&A, 6.2% on R&D, and has inventory turns of 41.9, operating income of 15.0%, net income of 11.3%, free cash flow of 10.4%, and return on invested capital of 6.8%.

	REVENUE	(TTM)		OPERAT	IONS	PRO				
	Annual Revenue		Iny		Inventory	Operating	Free Cash			
	(\$M)	3-Year CAGR	Gross Margin	SG&A	R&D	Turns	Income	Net Income	Flow	ROIC
Average	\$13,299	1.0%	56.5%	17.1%	6.2%	41.9	15.0%	11.3%	10.4%	6.8%
Median	\$3,722	0.6%	56.9%	15.4%	2.0%	22.0	14.0%	7.9%	11.5%	6.0%

Notes:

1. TTM = trailing twelve months. All revenue and cost numbers are based on trailing twelve months results as of the date on the cover of this report. This report provides the averages of the percentages of all companies, including outliers.

2. Growth rate is based on the past four years of financial results

3. All percentage numbers are a percentage of revenue. Average is the average of all the percentages for each of the companies.

Analysis Summary Average values by revenue quartile, TTM¹

Market cap multiples are consistent across the revenue quartiles. Gross margins and profit are lower for the smallest companies but consistent in the top three quartiles.

All numbers are averages within each quartile

		REVENUE	(TTM)	MKT CAP		OPERA	TIONS		PR			
			3-Year	Mkt Cap/	Gross			Inventory	Operating		Free Cash

Economic Profit	2.1%	7.0%	-0.6%	0.4%	1.5%	5.5 pps

NOTES & INSIGHTS

- Leaders have market cap multiples that are 2.4X average, and 9.7X laggards.
- The one clear determinant of leaders is return on investment; top quartile market cap multiple leaders excel in all forms of ROI (ROA, ROIC, ROCE and EP). This makes sense given Telecommunication is a capital-intensive industry requiring high levels of CAPEX.
- Inventory is not a significant factor for most
 Telecommunication companies. These companies
 are largely service providers and must deploy
 significant physical assets in order to competitive
 deliver such service.
- All financial numbers are for the trailing twelve months as of the date on the cover of this report. All market cap numbers are as of the date on the cover of this report.

Appendix

Additional supporting material and notes.

Notes and Definitions

- 1. Primary data sources for the analysis are YCharts and Calcbench.
- 2. Companies included in this analysis are filtered based on available financial, operational, and market cap data. Some significant companies such as Samsung and LG have been excluded because of lack of market capitalization data from the primary data sources.
- 3. Free cash flow = operating cash flow minus CAPEX.
- 4. ROA = return on assets = net income divided by total assets.
- 5. ROIC = return on invested capital = net income divided by (total debt plus equity).
 - 1. Note: the formal definition of ROIC uses NOPAT in the numerator. Furthermore, some companies may employ their own specific definition. The results here will be close to the formal definition, but generally slightly less.
- 6. ROCE = return on capital employed = EBIT divided by capital employed. Capital employed = total assets minus total current liabilities.
- 7. ROPA = return on physical assets = operating profit divided by (PP&E (net) plus inventory).
- 8. Economic profit = net operating profit after taxes (NOPAT) minus weighted average cost of capital (WACC) times capital invested. Capital invested = Equity plus the non-current portion of debt. WACC is industry-specific, as publicly reported by Aswath Damodaran, NYU Stern Business School.
- 9. Inventory turns = COGS (end of period) divided by inventory (end of period).
- 10. C2C = cash-to-cash in days = days in receivables plus days in inventory minus days in payables.
- 11. Unless otherwise noted, all data are based on the most recent fiscal year (MRY) for each company, as reported in the SEC EDGAR database as of the date on the cover of this report.
- 12. Historical data is for fiscal years 2010-2020 for all companies. The number of companies grows for each year in the historical analysis, as more companies became public across the decade.
- 13. In the case of companies formed from mergers, the oldest company is used to designate the resultant company founding year.
- 14. 3-Year CAGR is based on the past four years of annual financial data.
- 15. Market capitalization is based on the stock prices as of the date on the cover of this report for each company. Market cap to revenue ratios are market capitalization divided by trailing twelve months (TTM) revenue through the most recently reported fiscal quarter as of the date on the cover of this report.
- 16. EBITDA is calculated as operating income plus depreciation and amortization.
- 17. Adjusted EBITDA = EBITDA minus stock compensation
- 18. Cash = cash, cash equivalents, and marketable securities.
- 19. Total debt includes short-term debt, the current portion of long-term debt, long-term debt, borrowings under credit facility, capital lease obligations, convertible notes, and deferred rent.
- 20. CAPEX = gross CAPEX, in other words it does not net out the sale of assets.
- 21. Enterprise value (EV) = market cap plus total debt minus cash.
- 22. Most companies allocate depreciation and amortization costs to individual cost buckets, including cost of revenue, SG&A, and R&D. Some subset of companies explicitly show depreciation and amortization costs on the income statement after the other cost buckets. No attempt was made to reallocate these costs for this subset of companies. This has the effect of understating COGS, SG&A, and R&D for those companies.
- 23. Individual company YOY numbers may be distorted due to mergers and acquisitions. No attempt has been made to normalize for mergers, acquisitions, and divestitures.

Notes and Definitions

24. Aggregate inventory turns is calculated as follows: sum of all COGS for all companies in an industry divided by sum of all inventories for all companies in an industry. In a certain small number of cases, companies do not have an inventory entry on their balance sheets. In this case, to maintain consistency across calculations, inventory is assumed to be zero for those companies. This is most prevalent in service-oriented industries such as transportation and wholesale distribution, where certain companies own zero inventory. This may have the effect of slightly overstating aggregate inventory turns versus if the calculation were only done for those companies that carry inventory. (Note: in goods-producing industries, companies without COGS or without inventories have been filtered out of the analysis).
